Hiring Team
Crowe Studio

Dear Hiring Team,

Crowe Studio's Forward Deployed Engineering model is built around a demanding promise: move faster than traditional professional services without separating technical delivery from client outcomes, adoption, and lasting capability. That is exactly the seam where I have spent my career—making complex work visible, translating between technical and operating teams, and building mechanisms that turn emerging technology into reliable work.

At Vape-Jet, I work directly across production, quality, customer success, support, engineering issue flow, ERP/Odoo, telemetry, and AI-assisted workflows in a software-enabled robotics environment with approximately 1,000 fielded robots. Through DudeWorth, I develop AI-readiness and agentic workflow patterns using structured context, retrieval, human judgment, escalation, evaluation, and governance. Earlier, I led Amazon Prime Pittsburgh execution in a 24/7 customer-backward environment supporting approximately five million second-day orders annually, and I led engineering, manufacturing, quality, and customer delivery in high-reliability electronics at Compunetics.

The common thread is not a title. It is direct operating work: framing the outcome, understanding the workflow, connecting systems and stakeholders, defining authority, testing the mechanism, and creating ownership so the result survives. That through-line fits a senior forward-deployed consultant who must facilitate discovery, build proof, communicate with executives, support technical teams, and leave the client more capable.

My operating thesis for Crowe: an AI workstream is complete only when outcome, workflow, authority, evidence, integration, and client ownership arrive together.

I made that thesis tangible in an independent candidate vision at <https://russelldudek.github.io/Crowe/>. The site includes an interactive Outcome Span that changes the delivery decision when speed, agent autonomy, legacy integration, or ownership pressure weakens the workstream; it also includes a 90-day plan and an FDE Workstream Review. The point is not to prescribe Crowe's internal method from the outside. It is to make my reasoning and contribution posture testable.

My platform judgment starts with the work: connector fit, data and API boundaries, action authority, governance, evaluation, supportability, adoption, and time-to-value. That discipline helps teams choose and configure automation mechanisms that can move from proof into durable client operation.

I would be glad to discuss how this combination of hands-on AI workflow design, operating rigor, technical translation, and client-centered execution could help Crowe Studio deliver complete workstreams and compound the practice's learning.

Sincerely,

Russell Dudek
